DAMS SECTOR PROFILE

The Dams Sector delivers critical water retention and control services in the United States, including hydroelectric power generation, municipal and industrial water supplies, agricultural irrigation, sediment and flood control, river navigation for inland bulk shipping, industrial waste management, and recreation. Its key services support multiple critical infrastructure sectors and industries. Dams Sector assets provide enough water for 130 million people, irrigation for 4 percent of cropland, and generate renewable hydroelectric power for 10 million homes.

Sector assets include dam projects (dams), navigation locks, levees, hydropower projects, dikes, hurricane barriers, tailings dams, and other industrial waste impoundments.

Critical Sector Dependencies and Interdependencies

**Emergency Services**
Law enforcement is among the first responders during Dams Sector asset failure or disruption, and their response capabilities can determine the extent of event consequences.

**Transportation**
The Nation’s 12,000-mile inland marine network relies on navigation locks to move valuable products throughout the United States.

**Energy**
More than 20 percent of coal used to produce U.S. electricity is shipped via inland waterways that rely on navigation locks.

**Food & Agriculture**
About 60 percent of the country’s farm exports travel through inland waterways for export overseas. Four percent of U.S. cropland is irrigated by dams.

**Communications**
Uninterrupted Internet and telecommunication networks are essential for employee communications and remote monitoring and control.

**Nuclear**
Dams may store water for cooling operations near nuclear facilities.

**Information Technology**
Information technology systems control critical processes, manage day-to-day operations, and store sensitive information for the Dams Sector.

**Water**
About 70 percent of all freshwater used in the United States comes from surface-water sources, including reservoirs created by dams.

**Chemical**
Chemicals and fertilizers are major commodities shipped via inland waterways.

Completion of U.S. Dams by Year

- The average dam in the United States is **57 years old**.
- **Half** of all dams were built between **1950** and **1979**.
- **15,426 dams** have an undetermined build date.

The Dams Sector: Integral to Everyday Life

Dams Sector assets provide a wide range of economic, environmental, and social benefits, including hydroelectric power; river navigation; water supply for municipal, industrial, and agricultural uses; flood control; efficient water resource management in drought- and flood-prone regions; waste management; recreation; and wildlife habitat protection. Assets range from large hydroelectric dams and river/coastal levee systems that support and protect whole U.S. regions to small, locally owned dams and levees that support and protect individual agricultural communities.
The purpose of a dam is to store water, wastewater, or liquid-borne materials for any of several reasons, such as flood control, human water supply, irrigation, livestock water supply, energy generation, containment of mine tailings, recreation, or pollution control. Many dams fulfill a combination of the above functions. While there are more than 91,000 dams in the National Inventory of Dams database, there are more than 100,000 dams across the U.S. and Puerto Rico.

**Water storage and irrigation**
Dams create reservoirs that supply water for many industrial, municipal, agricultural, and recreational uses.

**Sediment and flood control**
Some dams control sedimentation for environmental protection or regulate and contain water flow to reduce or prevent flooding.

**Recreation**
More than 262 million people visit at least one U.S. Army Corps of Engineers (USACE) facility each year.

**Tailings**
Tailings, or waste from mining, electric, and manufacturing industries, are collected and suspended in water, then settle out in an impoundment, or tailings dam. Tailings are often used as part of the structure itself.

**Embankment dams** are the most common type of dam in use today. Materials used for embankment dams include natural soil or rock, or waste materials obtained from mining or milling operations.

**Earthfill:** compacted earth

**Rockfill:** compacted or dumped rock

**Tailings dam:** industrial waste material

**Masonry or concrete dams** may be categorized according to the designs used to resist the stress due to reservoir water pressure. Three common types of concrete dams are:

**Gravity**
The most common form of concrete dam. The mass weight of concrete and friction resists the reservoir water pressure.

**Buttress**
Mass of concrete is reduced, and the forces are diverted to the dam foundation through vertical or sloping buttresses.

**Arch**
Typically thin in cross-section. The reservoir water forces acting on an arch dam are carried laterally into the abutments.

**Electricity generation**
Hydropower dams produce 8-12 percent of the Nation’s power needs accounting for 52 percent of U.S. renewable energy. The United States is one of the largest producers of hydropower in the world.

**Renewable, clean energy**
Without hydropower, the U.S. would have to burn an additional 121 million tons of coal, 27 million barrels of oil, and 741 billion cubic feet of natural gas combined.

**Peaking power**
Hydroelectric projects can ramp up to meet peak demand.

**Blackstart capabilities**
Hydropower projects can quickly and efficiently start generating electricity to jumpstart restoration for other non-hydro generators after system-wide blackouts.

**High hazard dams**
High hazard dams are those where failure or mis-operation will likely cause loss of human life. Hazard classification refers to the potential consequences of a dam’s failure, not the condition of the dam.

**Dam Ownership**

- Private: 63%
- Public Utility: 20%
- Local gov’t: 7%
- State gov’t: 4%
- Federal gov’t: 4%
- Not listed: 1%
Navigation locks make inland waterways viable transportation corridors by allowing commercial and recreational traffic to move safely between river pools and harbors. The USACE oversees locks as part of a larger marine highway network that stretches across the country. Navigation locks enable companies to ship large volumes of bulk commodities over long distances far more efficiently than via truck or rail, reducing shipping costs and greenhouse gas emissions.

**Efficiency of Inland Waterways**

1 barge carries the same amount of goods as 16 rail cars or 70 trucks.

**On a single gallon of fuel**, a barge can move 1 ton of cargo 500 miles further than trucks.

**More than 514 million** tons of cargo (valued at more than $134 billion) was moved by inland marine network in 2019.

Waterways primarily move coal, petroleum products, and additional exports. Other major commodities include:

- **Aggregates** such as stone, sand, and gravel used in construction.
- **Chemicals** including fertilizers, metal ores, and minerals.
- **Grain** and farm products.
- Products, such as **steel**.
- Other **manufactured products**.

Inland Waterways of the United States

- **14%** of U.S. freight is carried on inland waterways.
- **20%** of coal used to generate electricity is moved on inland waterways.
- **22%** of domestic petroleum and petroleum products are moved on inland waterways.
- **60%** of grain exports are moved by barge.

Millions of tons of cargo shipped per year

- **250**
- **125**
- **62.5**

LEVEES

Levee systems, or “levees”, are man-made structures that reduce risk by diverting the flow of water from floods and storm surges. Levees usually consist of earthen embankments or floodwalls in combination with other features, such as closure structures, pumping stations, and interior drainage works. Levees help with flood control efforts on floodplains for millions of people and trillions of dollars in property across the Nation.

Though levees do not eliminate all flood risk, they are an important flood risk management tool that can help reduce the frequency of flooding and provide valuable time for evacuations.

Levees help reduce flooding of infrastructure critical to everyday life, including roads, hospitals, and police departments, as well as other resources critical to flood response, evacuation, and recovery.

These infrastructure include:

- Agriculture farms and property
- Chemical plants
- Emergency medical services
- Entertainment venues
- Law enforcement
- Schools and universities
- Water supply
- Water treatment plants

The current inventory of nearly 30,000 miles of levees in the National Levee Database, helps defend communities, critical infrastructure, and valuable property from flooding.

*There are additional levees located in Puerto Rico, the U.S. Virgin Islands, and Guam.*
 ROLE OF GOVERNMENT IN DAM SAFETY AND SECURITY

**Dams**

Today, every state except Alabama has a dam safety regulatory program. Select states also oversee dam security.

State governments have regulatory responsibility for 69 percent of the more than 91,000 dams within the National Inventory of Dams (NID). These programs vary in authority, but typically the program activities include:

- Safety evaluations of existing dams
- Review of plans and specifications for dam construction and major repair work
- Periodic inspections of construction work on new and existing dams
- Review and approval of emergency action plans

**Tailings dams, or impoundments, are primarily owned and operated by private industries and can be subject to federal and/or state regulations depending on type and size.**

**Federal Agencies**

Federal agencies involved with dam safety or security:

<table>
<thead>
<tr>
<th>U.S. Department of Agriculture</th>
<th>Natural Resources Conservation Service</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Provides technical and financial assistance for almost 27,000 NID dams and financial assistance for another 11,000 NID dams designed for agricultural water storage, sediment retention, and flood protection.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>U.S. Department of Defense</th>
<th>U.S. Army Corps of Engineers</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Owns and operates dams and maintains more than 500 miles of levees and associated floodways along the lower portion of the Rio Grande River.</td>
</tr>
</tbody>
</table>

The NID lists more than 91,000 dams in the U.S., of which the private sector owns 63 percent and state or local entities own 27 percent.

About 14 percent of dams in the United States are owned or regulated by federal agencies.

The Federal Government owns and self-regulates only 5 percent of dams, yet 80 percent of these dams are the largest in the U.S.
